01

Expert tips for choosing the right home lift

Investing in a home elevator is a significant decision that requires careful thought and planning. Whether you're future-proofing your forever home, improving accessibility for a loved one, or simply adding a touch of luxury, making an informed choice is crucial.

Visit a showroom

There is no substitute for seeing a product in person. Visiting a showroom allows you to experience the true size, finish, and operational feel of an elevator. You can step inside the cabin, interact with the controls, and genuinely appreciate the build quality.

Get your technical questions answered

A reliable lift provider should be able to answer every technical question you throw at them. Ask about pit depths, overhead clearance, electrical requirements, and the differences between drive systems. Your safety and the structural integrity of your home depend on accurate technical planning.

Research and compare

Understand the pros and cons of various drive mechanisms and learn about standard safety features, like battery backups and emergency lowering systems. Look beyond the initial price tag: evaluate customer service, the comprehensiveness of warranties, and post-installation maintenance plans.

Our home lift range

Vector Pro

Our premium residential elevator: safe, smooth and silent. Hydraulic drive, up to 400 kg (5 persons).

Zenith Ultra

Advanced belt-drive, near-silent and fully custom-built. Up to 450 kg (6 persons).

Atlus

Electric hybrid screw drive with a smooth, quiet ride. Low to no pit (50–150 mm).

For tighter spaces, the Levare Compact and Levare Plus are no pit, shaft-less designs with an electric belt motor; the Levare Plus is wheelchair friendly.

Take your time. Buying a home lift is not a rushed purchase. Ask the hard questions, and trust your instincts when comparing providers.

02

Key design considerations for seamless integration

In contemporary architecture, a home lift is more than just a utility: it is a design statement. Modern luxury elevators are designed to complement open-plan living and high-end interiors, often featuring glass shafts and minimalist hardware that blend with your decor.

Space

The space required depends on the model. The Vector Pro is designed to be compact, often fitting into the space of a standard closet. The Zenith Ultra may require more space due to its larger capacity and custom configurations. We offer a free consultation to assess your home's specific needs.

Pit

Most modern home lifts need only a shallow pit, somewhere between 30mm and 200mm below the lowest floor. Some models run with no pit at all using a small ramp into the car.

Headroom

Around 2.4 metres of clear height above the top landing floor covers most compact home lifts, and some models work with less. Standard 2.4 and 2.7 metre ceilings are fine. Raked ceilings, roof trusses and bulkheads are the usual complications, and they're a common reason a lift gets relocated to a different part of the house during design.

Wheelchair access

A car that takes a wheelchair and a carer needs internal dimensions of roughly 1100mm by 1400mm, which is noticeably bigger than a standard two person cabin and needs a larger shaft to suit. Retrofitting a bigger car later is rarely practical, so raise wheelchair access at the first site visit.

Existing homes and heritage areas

Yes, you can put a lift in an existing house: a large percentage of home lifts are retrofitted. An internal lift usually doesn't touch the streetscape at all, which is why it's often an easier approval than a rear addition, but it's still a conversation to have with your council before you commit.

Plan for the future. If you're planning a future extension, factor that in now. Adding an extra stop later is always more expensive than building it in from the start.

03

Understanding technical specifications and requirements

Key specifications for our home elevator range. Bespoke sizing is available.

	Vector Pro	Zenith Ultra	Atlus
Capacity	Up to 400 kg (5 persons)	Up to 450 kg (6 persons)	Up to 400 kg (5 persons)
Speed	0.25 m/s	0.3 – 0.4 m/s	0.15 – 0.30 m/s
Cabin dimensions	750 × 700 to 1100 x 1350 mm	1000 × 1200 mm, 1100 × 1400 mm	750 × 700 to 1100 x 1350 mm
Max travel	10 m, up to 4 stops	–	–
Drive	Hydraulic (silent submerged motor)	Advanced belt-drive	Electric hybrid screw drive
Pit	–	–	Low to no pit (50 – 150 mm)
Power supply	Single phase 230VAC	Single phase 230VAC, with energy recovery system	Single phase 230VAC
Wheelchair friendly	Yes	Yes	Yes
Installation	1–2 weeks	1–2 weeks	1–2 weeks
Warranty	5 years	5 years	5 years

Power

All our home elevators run on single phase 230VAC power, as do the Zenith DDA and RB150. Only the E1 commercial lift needs three phase power.

Standards

Our elevators are built to AS 1735, with full adherence to Australian Lift Standards. Our commercial lifts are DDA compliant, with tactile controls, auto doors and compliant cabins.

Drive systems

Hydraulic elevators are smooth, reliable workhorses. Traction elevators are efficient across multiple floors and well-suited to taller homes. Screw-driven lifts are compact, machine-room-free, and often represent excellent mid-range value.

04

Budgeting and cost-saving strategies

Home elevator cost in Australia typically ranges from **$36,000 to $100,000+**, depending on the lift type, number of levels served, shaft requirements, cabin dimensions, and interior finish. These are indicative 2026 estimates for Melbourne and greater Victoria; final pricing depends on your property. We conduct a site assessment before quoting, and you get a free quote in 24 hours.

What drives the price

- **Lift type and drive system.** Different drive systems suit different homes and budgets.
- **Number of levels.** A lift serving two floors costs meaningfully less than one serving three or four. Each additional stop requires more rail, more electrical work, and more installation time.
- **Shaft construction.** In a new build, the shaft is planned from the start and absorbed into the broader construction budget. In an existing home, creating a shaft is a structural undertaking.
- **Cabin size and finish.** A wheelchair-accessible cabin is larger and costs more. Glass walls, timber veneers, stone flooring and bespoke lighting all push the price up.

Running costs

Very little. Most residential lifts use single phase household power and draw about as much over a year as a fridge, since they only run for a few seconds at a time. Servicing is the more meaningful ongoing cost, plus the phone or GSM connection for the emergency call unit.

Funding

NDIS home modification funding can cover a lift for eligible participants where it's assessed as reasonable and necessary. If you're approved for Support at Home, the AT-HM scheme can contribute up to $15,390. An occupational therapist (OT) has to prescribe the work, and we work with your OT on funding quotes.

Warranty

A factory backed 5-year warranty on all our full elevators, and 2 years on the Levare compact lifts.

05

Installation process overview

1. **Free quote and site visit.** We assess your home's structure, measure available space, discuss lift type options, and walk you through what the installation will involve.
2. **Design and production.** A full specification: shaft dimensions, structural requirements, electrical supply needs, cab finish selections and any custom features.
3. **Installation.** Our certified technicians handle the entire installation process, with minimal disruption to your home, and conclude with rigorous safety testing.
4. **Handover and servicing.** Once signed off, we hand over your operating manuals and warranty documents, and keep your lift running with ongoing servicing.

Permits

In Victoria, installing a lift in a home is building work, so you'll generally need a building permit issued by a registered building surveyor before anything starts.

How long does installation take?

Models	On-site installation
Levare Compact, Levare Plus	About 2 days
Vector Pro, Zenith Ultra, Atlus	1–2 weeks
Zenith DDA, E1, RB150 (commercial)	2–4 weeks

The on-site installation is just one part of a longer process. The single biggest variable is not the installation itself: it is the permit and approval phase.

Keep your project on track. Respond promptly to any information requests from your building surveyor, have your electrical supply sorted early, keep the installation area clear and accessible on the agreed start date, and make finish selections decisively during design.

06

Maintenance and safety guidelines

Built-in safety

Safety is our top priority. All our elevators exceed Australian safety standards and come equipped with multiple redundant safety features, including emergency brakes, battery backup for lowering in a power outage, and in-cabin emergency communication systems.

If the power goes out

Home lifts have a battery backup that brings the car to the nearest landing and opens the door, so nobody is left sitting in a stopped lift.

How often to service

We recommend a minimum of one service per year, twice-yearly for heavily used lifts, or as outlined by the manufacturer's servicing schedule. Skipping services can also affect your warranty, so check the terms before letting a visit slide.

What a technician checks

- Safety systems first: emergency stop, door interlocks, overspeed and safety gear, and the emergency lowering or battery backup.
- The drive and mechanical side, including lubrication and wear on guide rails and rollers.
- Doors: the door operator, sensors and alignment.
- Controls and communications: buttons, displays, levelling accuracy at each floor, and the emergency phone or intercom.

Don't wait for the next visit if you notice

New or louder noises such as grinding or clunking, jerky starts or stops, a car that stops unevenly with the floor, or doors that hesitate or reopen for no reason. If anything touches on safety, stop using the lift until it's been inspected.
